

**VSQuerycount/vsqfnelt**

intn VSQuerycount(int32 *vdata\_id*, int32 \**n\_records*)

*vdata\_id*           IN:       Vdata access identifier returned by **VSattach**

*n\_records*         OUT:       Number of records in the vdata

**Purpose**           Retrieves the number of records in a vdata.

**Return value**    Returns **SUCCESS** (or 0) if successful and **FAIL** (or -1) otherwise.

**Description**     **VSQuerycount** retrieves the number of records in the vdata identified by *vdata\_id* in the parameter *n\_records*.

**FORTRAN**         integer function vsqfnelt(*vdata\_id*, *n\_records*)

                  integer *vdata\_id*, *n\_records*

## VSQueryfields/vsqfflds

intn VSQueryfields(int32 *vdata\_id*, char \**field\_name\_list*)

*vdata\_id*           IN:       Vdata access identifier returned by **VSattach**  
*field\_name\_list*   OUT:       List of field names

**Purpose**           Retrieves the names of the fields in a vdata.

**Return value**   Returns `SUCCESS` (or 0) if successful and `FAIL` (or -1) otherwise.

**Description**   **VSQueryfields** retrieves the names of the fields in the vdata identified by the parameter *vdata\_id* into the parameter *field\_name\_list*.

The parameter *field\_name\_list* is a comma-separated list of the fields in the vdata. (i.e., "PX,PY,PZ" in C and 'PX,PY,PZ' in Fortran).

FORTTRAN           integer function vsqfflds(*vdata\_id*, *field\_name\_list*)

integer *vdata\_id*

character\*(\*) *field\_name\_list*

**VSQueryinterlace/vsqfintr**

intn VSQueryinterlace(int32 *vdata\_id*, int32 \**interlace\_mode*)

*vdata\_id* IN: Vdata identifier returned by **VSattach**

*interlace\_mode* OUT: Interlace mode

**Purpose** Retrieves the interlace mode of the vdata.

**Return value** Returns `SUCCESS` (or 0) if successful and `FAIL` (or -1) otherwise.

**Description** **VSQueryinterlace** retrieves the interlace mode of the vdata identified by the parameter *vdata\_id* into the parameter *interlace\_mode*.

Valid values for *interlace\_mode* are `FULL_INTERLACE` (or 0) and `NO_INTERLACE` (or 1).

**FORTRAN** integer function vsqfintr(*vdata\_id*, *interlace\_mode*)

integer *vdata\_id*, *interlace\_mode*

## VSQueryname/vsqfname

intn VSQueryname(int32 *vdata\_id*, char \**vdata\_name*)

*vdata\_id*           IN:       Vdata identifier returned by **VSattach**

*vdata\_name*       OUT:       Name of the vdata

**Purpose**           Retrieves the name of a vdata.

**Return value**   Returns `SUCCESS` (or 0) if successful and `FAIL` (or -1) otherwise.

**Description**   **VSQueryname** retrieves the name of the vdata identified by the parameter *vdata\_id* into the buffer *vdata\_name*.

FORTRAN           integer function vsqfname(*vdata\_id*, *vdata\_name*)

                  integer *vdata\_id*

                  character\*(\*) *vdata\_name*

**VSQueryref/vsqref**

int32 VSQueryref(int32 *vdata\_id*)

*vdata\_id*      IN:      Vdata identifier returned by **VSattach**

**Purpose**              Returns the reference number of a vdata.

**Return value**      Returns the reference number of the vdata if successful and `FAIL` (or `-1`) otherwise.

**Description**      **VSQueryref** returns the reference number of the vdata identified by the parameter *vdata\_id*.

FORTRAN              `integer function vsqref(vdata_id)`

`integer vdata_id`

## VSQuerytag/vsqttag

int32 VSQuerytag(int32 *vdata\_id*)

*vdata\_id*        IN:        Vdata identifier returned by **VSattach**

**Purpose**        Returns the tag of the specified vdata.

**Return value** Returns the tag of the vdata if successful and `FAIL` (or `-1`) otherwise.

**Description** Returns the tag of the vdata identified by the parameter *vdata\_id*.

FORTTRAN        `integer function vsqttag(vdata_id)`

`integer vdata_id`

**VSQueryvsize/vsqfvsiz**

intn VSQueryvsize(int32 *vdata\_id*, int32 \**vdata\_size*)

*vdata\_id*            IN:        Vdata identifier returned by **VSattach**

*vdata\_size*        OUT:        Size of the vdata record

**Purpose**            Retrieves the size of a record in a vdata.

**Return value**     Returns **SUCCESS** (or 0) if successful and **FAIL** (or -1) otherwise.

**Description**      **VSQueryvsize** retrieves the size, in bytes, of a record in the vdata identified by the parameter *vdata\_id* into the parameter *vdata\_size*. The returned size value is machine dependent.

**FORTRAN**            integer function vsqfvsiz(*vdata\_id*, *vdata\_size*)

integer *vdata\_id*, *vdata\_size*
