

# HDF5 Dynamically Loaded Filters

## The HDF Group

---

This document describes the HDF5 dynamically loaded filter feature (HDF5 filter plugin) that will be released in the HDF5 version 1.8.11 in May 2013.

This feature allows an HDF5 application to apply a non-native HDF5 filter during I/O operations at runtime. The application does not need to register the filter with the HDF5 Library. There is no need for adding the filter to the HDF5 Library and then linking the application with the modified library.

For example, the HDF5 1.8.11 command-line tools such as h5dump or h5ls downloaded from The HDF Group website, or Java-based browsing tool HDFView that uses 1.8.11 will be able to read LZF or bzip2 compressed datasets created by H5Py or PyTables software.

The dynamically loaded filter feature was sponsored by **Deutsches Elektronen-Synchrotron (DESY)**, Hamburg, Germany.

## 1 Introduction

The HDF5 Library provides an internal mechanism to compress an HDF5 dataset's raw data and the links stored in an HDF5 group object. Readers who are unfamiliar with HDF5 compression are encouraged to view the HDF5 tutorials, the *HDF5 User's Guide*, the *HDF5 Reference Manual* and other documentation available from the <http://www.hdfgroup.org> website.

The HDF5 compression mechanism is a part of the HDF5 "filter pipeline" that modifies an application's data during the I/O operations. The pipeline was designed to be extensible. New filters could be easily added to the pipeline by an application, or the HDF5 Library code can be modified with a new filter to be later used by an application.

The HDF5 Library supports several "internal" filters (see in the *HDF5 User's Guide*, section 5.4.2, "Data Pipeline Filters"). Two filters, *deflate* and *gzip*, depend on third-party compression libraries. All internal filters are configurable. They can be added or removed during the configuration step when the HDF5 Library is built.

While currently available HDF5 "internal" compression methods work reasonably well on users' datasets, there are certain drawbacks to the current implementation. First, the "internal" compression methods may not provide the optimal compression ratio, as do some newly developed or specialized compression methods. Secondly, if a data provider wants to use a "non-internal" compression for storing the data in HDF5, he/she has to write a filter function that uses the new compression method and then register it with the library. Data consumers of such HDF5 files will need to have the new filter function and use it with their applications to read the data, or they will need a modified version of the HDF5 Library that has the new filter as a part of the library.

If a user of such data does not have a modified HDF5 Library installed on his system, command-line tools such as `h5dump` or `h5ls` will not be able to display the compressed data. Furthermore, it would be practically impossible to determine the compression method used, making the data stored in HDF5 useless.

It is clear that the current HDF5 filter mechanism, while extensible, does not work well with third-party filters. It would be a maintenance nightmare to keep adding and supporting new compression methods in HDF5. For any set of HDF5 "internal" filters, there always will be data with which the "internal" filters will not achieve the optimal performance needed to address data I/O and storage problems. Thus the current HDF5 filter mechanism should be enhanced to address the issues discussed above.

We have added a new feature to HDF5 called "dynamically loaded filters in HDF5." This feature will make the HDF5 third-party filters available to an application at runtime. The third-party HDF5 filter function has to be a part of the HDF5 filter plugin installed on the system as a shared library or DLL.

To use a third-party filter an HDF5 application should call the `H5Pset_filter` function when setting the filter pipeline for a dataset creation property. The HDF5 Library will register the filter with the library and the filter will be applied when data is written to the file.

When an application reads data compressed with a third-party HDF5 filter, the HDF5 Library will search for the required filter plugin, register the filter with the library (if the filter function is not registered) and apply it to the data on the read operation.

This document describes this new feature and provides details in the following sections.

## 2 Requirements

The current design for the HDF5 dynamically loaded filters feature addresses the requirements listed in the sections below.

### 2.1 Functional Requirements

1. There are **no changes to the HDF5 file format**.
2. There are **no changes to the HDF5 interface and the programming model** (see the “Programming Model for Applications” section on page 6) in order to use the feature.
3. The HDF5 third-party filters are available as **shared libraries or DLLs** on the user’s system. The minimum content of the shared library satisfies the requirements as documented in the “Programming Model for HDF5 Filter Plugins” section on page 10.
4. There are predefined **default locations** where the HDF5 Library searches the shared libraries or DLLs with the HDF5 filter functions.
5. The **default location may be overwritten** by an environment variable.
6. Once a filter plugin library is loaded, it stays loaded until the HDF5 Library is closed.

Future enhancements:

- The default search locations can be specified in a configuration file.

### 2.2 Non-functional Requirements

1. The HDF Group maintains a list of the third-party filters registered with HDF5 to facilitate tracking of a filter provenance. The current procedure is outlined at <http://www.hdfgroup.org/services/contributions.html>.
2. The HDF group publishes a specification and provides examples of dynamic loaded filters libraries.

Future enhancements:

- The HDF Group provides a repository such as SVN or GIT for the third-party filters and outlines a testing procedure that can be used by the filters maintainers to test the filters with the HDF5 libraries under development.

### 3 Programming Model for Applications

This section describes the programming model for an application that uses a third-party HDF5 filter plugin to write or read data. For simplicity of presentation, it is assumed that the HDF5 filter plugin is available on the system in a default location. The HDF5 filter plugin is discussed in detail in the “Programming Model for HDF5 Filter Plugins” section on page 10.

#### 3.1 Applying a Third-party Filter When Creating and Writing a Dataset

A third-party filter can be added to the HDF5 filter pipeline by using the `H5Pset_filter` function, as a user would do in the past. The identification number and the filter parameters should be available to the application. For example, if the application intends to apply the HDF5 bzip2 compression filter that was registered with The HDF Group and has an identification number 307 (see <http://www.hdfgroup.org/services/contributions.html>) then the application would follow the steps as outlined below:

```

dcp1 = H5Pcreate (H5P_DATASET_CREATE);
status = H5Pset_filter (dcp1, (H5Z_filter_t)307, H5Z_FLAG_MANDATORY,
                       (size_t)6, cd_values);

dset = H5Dcreate (file, DATASET, H5T_STD_I32LE, space, H5P_DEFAULT, dcp1,
status = H5Dwrite (dset, H5T_NATIVE_INT, H5S_ALL, H5S_ALL, H5P_DEFAULT,
                  wdata[0]);

```

#### 3.2 Reading Data with an Applied Third-party Filter

An application does not need to do anything special to read the data with a third-party filter applied. For example, if one wants to read data written in 3.1 the following regular steps should be taken:

```

file = H5Fopen (FILE, H5F_ACC_RDONLY, H5P_DEFAULT);
dset = H5Dopen (file, DATASET, H5P_DEFAULT);
H5Dread (dset, H5T_NATIVE_INT, H5S_ALL, H5S_ALL, H5P_DEFAULT,
        rdata[0]);

```

The 1.8.11 version of the command-line utility `h5dump`, for example, will read and display the data as shown:

```

[epourmal@jam example]$ ./h5dump -p *.h5
HDF5 "h5ex_d_bzip2.h5" {
GROUP "/" {
  DATASET "DS1" {
    DATATYPE  H5T_STD_I32LE
    DATASPACE  SIMPLE { ( 32, 64 ) / ( 32, 64 ) }
    STORAGE_LAYOUT {
      CHUNKED ( 4, 8 )
      SIZE 6410 (1.278:1 COMPRESSION)
    }
    FILTERS {

```

```

    USER_DEFINED_FILTER {
        FILTER_ID 307
        COMMENT bzip2
        PARAMS { 6 }
    }
}
...
}
DATA {
(0,0): 0, -1, -2, -3, -4, -5, -6, -7, -8, -9, -10, -11, -12, -13, -14,
(0,15): -15, -16, -17, -18, -19, -20, -21, -22, -23, -24, -25, -26,
(0,27): -27, -28, -29, -30, -31, -32, -33, -34, -35, -36, -37, -38,
(0,39): -39, -40, -41, -42, -43, -44, -45, -46, -47, -48, -49, -50,
(0,51): -51, -52, -53, -54, -55, -56, -57, -58, -59, -60, -61, -62,
(0,63): -63,

```

.....

Compare the output above with the output of the 1.8.10 version of h5dump shown below:

```

[epournal@jam example]$ h5dump -p *.h5
HDF5 "h5ex_d_bzip2.h5" {
GROUP "/" {
  DATASET "DS1" {
    DATATYPE  H5T_STD_I32LE
    DATASPACE  SIMPLE { ( 32, 64 ) / ( 32, 64 ) }
    STORAGE_LAYOUT {
      CHUNKED ( 4, 8 )
      SIZE 6410
    }
    FILTERS {
      UNKNOWN_FILTER {
        FILTER_ID 307
        COMMENT HDF5 bzip2 filter; see http://www.hdfgroup.org/services/contributions.html
        PARAMS { 6 }
      }
    }
  }
  ...
}
  DATA {h5dump error: unable to print data
}
}
}
}

```

The h5dump utility version 1.8.10 cannot read data compressed with bzip2 because the filter is not available to the HDF5 library.

The complete example of writing and reading data with an applied third-party HDF5 filter is shown in the “Example: Writing and Reading Compressed Data” section on page 18. Please notice that the application DOES NOT need to link with the HDF5 plugin library.

### 3.3 A Word of Caution When Using Custom Filters

Data goes through the HDF5 filter pipeline only when it is written to the file or read into application memory space from the file. For example, the I/O operation is triggered with a call to `H5Fflush`, or when a data item (HDF5 metadata or a raw data chunk) is evicted from the cache or brought into the cache. Please notice that `H5Dread/write` calls on the chunked datasets do not necessarily trigger I/O since the HDF5 Library uses a separate chunk cache.

A data item may remain in the cache until the HDF5 Library is closed. If the HDF5 plugin that has to be applied to the data item becomes unavailable before the file and all objects in the file are closed, an error will occur. The following example demonstrates the issue. Please notice the position of the `H5Zunregister` call:

```

/*
 * Create a new group using compression.
 */
gcpl = H5Pcreate (H5P_GROUP_CREATE);
status = H5Pset_filter(gcpl,H5Z_FILTER_BZIP2,H5Z_FLAG_MANDATORY,(size_t)1, cd_values);
group = H5Gcreate (file, GNAME, H5P_DEFAULT, gcpl, H5P_DEFAULT);
for (i=0; i < NGROUPS; i++) {
    sprintf(name, "group_%d", i);
    tmp_id = H5Gcreate (group, name, H5P_DEFAULT, H5P_DEFAULT, H5P_DEFAULT);
    status = H5Gclose(tmp_id);
}

status = H5Pclose (gcpl);
status = H5Gclose (group);
/*
 * Unregister the filter. Call to H5Fclose will fail because the library tries
 * to apply the filter that is not available anymore. This has a cascade effect
 * on H5Fclose.
 */
H5Zunregister(H5Z_FILTER_BZIP2);
status = H5Fclose (file);

```

Here is an error stack produced by the program:

```

HDF5-DIAG: Error detected in HDF5 (1.9.149) thread 0:
 #000: H5F.c line 2060 in H5Fclose(): decrementing file ID failed
   major: Object atom
   minor: Unable to close file
 #001: H5I.c line 1406 in H5I_dec_app_ref(): can't decrement ID ref count
   major: Object atom
   minor: Unable to decrement reference count
 #002: H5F.c line 1837 in H5F_close(): can't close file
   major: File accessibility
   minor: Unable to close file
.....
 #026: H5Z.c line 1045 in H5Z_find(): required filter is not registered
   major: Data filters
   minor: Object not found

```

To avoid the problem make sure to close all objects to which the filter is applied and flush them using the `H5Fflush` call before unregistering the filter.

## 4 Programming Model for HDF5 Filter Plugins

This section describes how to create an HDF5 filter, an HDF5 filter plugin, and how to install the HDF5 plugin on the system.

### 4.1 Writing a Filter Function

The HDF5 filter function for the dynamically loaded filter feature should be written as any custom filter described in <http://www.hdfgroup.org/HDF5/doc/H5.user/Filters.html>. See the “Example” section, section 5, of that document to get an idea of the simple filter function, and see the example of the more sophisticated HDF5 bzip2 filter function in the “Building an HDF5 bzip2 Plugin Example” section on page 17. The HDF5 bzip2 filter function is also available for download from [https://svn.hdfgroup.uiuc.edu/hdf5\\_plugins/trunk/BZIP2](https://svn.hdfgroup.uiuc.edu/hdf5_plugins/trunk/BZIP2).

The user has to remember a few things when writing an HDF5 filter function.

1. An HDF5 filter is bidirectional.

The filter handles both input and output to the file; a flag is passed to the filter to indicate the direction.

2. An HDF5 filter operates on a buffer.

The filter reads data from a buffer, performs some sort of transformation on the data, places the result in the same or new buffer, and returns the buffer pointer and size to the caller.

3. An HDF5 filter should return zero in the case of failure.

The signature of the HDF5 filter function and the accompanying filter structure (see the section below) are described in the *HDF5 Reference Manual*

[http://www.hdfgroup.org/HDF5/doc/RM/RM\\_H5Z.html#Compression-Register](http://www.hdfgroup.org/HDF5/doc/RM/RM_H5Z.html#Compression-Register).

### 4.2 Registering a Filter with The HDF Group

If you are writing a filter that will be used by others, it would be a good idea to request a filter identification number and register it with The HDF Group. Please follow the procedure described at <http://www.hdfgroup.org/services/contributions.html>.

The HDF Group anticipates that developers of HDF5 filter plugins will not only register new filters, but will also provide links to the source code and/or binaries for the corresponding HDF5 filter plugins.

It is very important for the users of the filter that developers provide filter information in the “name” field of the filter structure, for example:

```
const H5Z_class2_t H5Z_BZIP2[1] = {
    H5Z_CLASS_T_VERS,          /* H5Z_class_t version */
    (H5Z_filter_t) 307,        /* Filter id number */
    1,                          /* encoder_present flag (set to true) */
    1,                          /* decoder_present flag (set to true) */
    "HDF5 bzip2 filter; see
```

```

    http://www.hdfgroup.org/services/contributions.html",
        /* Filter info */
    NULL, /* The "can apply" callback */
    NULL, /* The "set local" callback */
    (H5Z_func_t) H5Z_filter_bzip2, /* The filter function */
};

```

The HDF5 Library and command-line tools have access to the “name” field. An application can use the `H5Pget_filter<*>` functions to retrieve information about the filters.

Using the example of the structure above, the `h5dump` tool will print the string “HDF5 bzip2 filter found at ...” pointing users to the applied filter (see the example in the “Reading Data with an Applied Third-party Filter” section on page 6) thus solving the problem of the filter’s origin.

### 4.3 Creating an HDF5 Filter Plugin

The HDF5 filter plugin source should include:

1. The `H5PLextern.h` header file from the HDF5 distribution.
2. The definition of the filter structure (see the example shown in the section above).
3. The filter function (for example, `H5Z_filter_bzip2`).
4. The two functions necessary for the HDF5 Library to find the correct type of the plugin library while loading it at runtime and to get information about the filter function:

```

H5PL_type_t  H5PLget_plugin_type(void);
const void*  H5PLget_plugin_info(void);

```

Here is an example of the functions above for the HDF5 bzip2 filter:

```

H5PL_type_t  H5PLget_plugin_type(void) {return H5PL_TYPE_FILTER;}
const void*  H5PLget_plugin_info(void) {return H5Z_BZIP2;}

```

5. Other functions such as the source of the compression library may also be included.

Build the HDF5 filter plugin as a shared library. The following steps should be taken:

1. When compiling, point to the HDF5 header files.
2. Use the appropriate linking flags.
3. Link with any required external libraries.
4. For example, if `libbz2.so` is installed on a Linux system, the HDF5 bzip2 plugin library `libH5Zbzip2.so` may be linked with `libbz2.so` instead of including `bzip2` source into the plugin library.

The complete example of the HDF5 bzip2 plugin library is provided at [http://svn.hdfgroup.uiuc.edu/hdf5\\_plugins/trunk/BZIP2/](http://svn.hdfgroup.uiuc.edu/hdf5_plugins/trunk/BZIP2/) and can be adopted for other

plugins. A simple Makefile file for Linux systems is shown in the “Example of Makefile” section on page 26.

#### 4.4 Installing an HDF5 Filter Plugin

The default directory for an HDF5 filter plugin library is defined on UNIX-like systems as

```
"/usr/local/hdf5/lib/plugin"
```

and on Windows systems as

```
"%ALLUSERSPROFILE%/hdf5/lib/plugin".
```

The default path can be overwritten by a user with the `HDF5_PLUGIN_PATH` environment variable. Several directories can be specified for the search path using “:” as a path separator for UNIX-like systems and “;” for Windows.

Readers are encouraged to try the example in the “Building an HDF5 bzip2 Plugin Example” section on page 17.

## 5 Design

Dynamic loading of the HDF5 filter plugin (or filter library) is triggered only by two events: when an application calls the `H5Pset_filter` function to set the filter for the first time, or when the data to which the filter is applied is read for the first time.

### 5.1 Data Writing

This section outlines the usage of the new feature on the write operation.

When the application enables a filter with `H5Pset_filter`, the library will search for it by its filter identifier. The library will first search for the filter among its internal filters and custom filters registered with the library, then it will search in the list of filters that have been dynamically loaded. If it cannot find the filter, it will search for the filter library in the default path or the path indicated by the environment variable `HDF5_PLUGIN_PATH`.

When found, the HDF5 Library will load the filter library, register the filter, and add it to the filter pipeline. There is no need for the application to register the dynamic filter with `H5Zregister`, as this step is done internally in `H5Pset_filter`. The `H5PL_load` function in the `H5Pocpl.c` file in the `src` directory of the HDF5 Library distribution does the searching and loading of the filter library.

Once the filter library is loaded, it will stay loaded until the HDF5 Library is closed or until the filter is unregistered with the `H5Zunregister` call. The `H5Zregister` function is still required when a third-party filter is linked into an application and is not provided as a shared library.

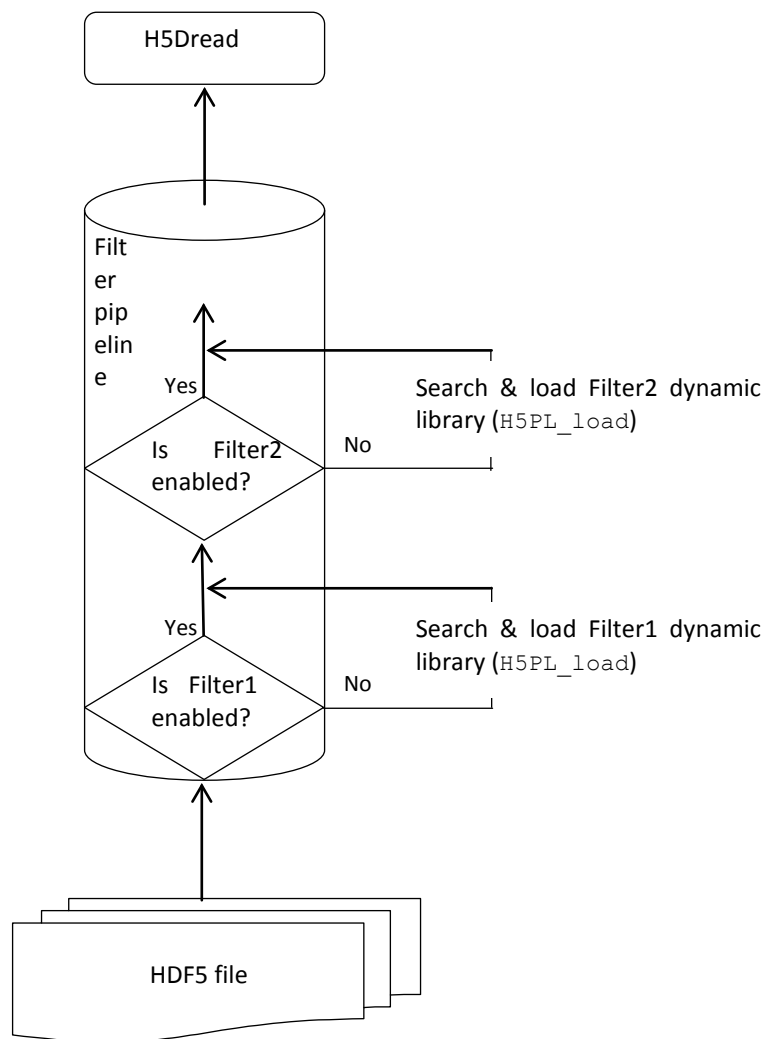

If the dynamically loaded filter has any auxiliary data, such as the compression level for `bzip2` filter, it can be passed in through the `cd_values` parameter of `H5Pset_filter`.

## 5.2 Data Reading

This section outlines the usage of the new feature on the read operation.

At the application level, the user does not need to do anything special. Inside the HDF5 Library, when the library sees a filter identification value associated with a data item, it first searches the filter among its internal filters, and then it searches in the list of dynamically loaded filters that have been loaded in the library. If it cannot find the filter, it will search for and load the filter plugin library. Once the filter library is loaded, it will stay open until the HDF5 Library is closed. Below is a simple diagram showing the design of the library.

Figure 1. Reading data with a dynamic loaded filter

The required changes were implemented in the `H5Z_pipeline` function that resides in the `H5Z.c` file in the `src` directory of the HDF5 Library distribution.

### 5.3 New HDF5 Source Files for Dynamically Loaded Filters

Three new source files were added to the HDF5 source code distribution under the `src` directory: `H5PLextern.h`, `H5PLprivate.h`, and `H5PL.c`. The `H5PL.c` file contains functions for managing plugins.

### 5.4 Testing Dynamically Loaded Filters

The `plugin.c` file in the `test` directory contains a test for the feature. The test is controlled by the `test_plugin.sh.in` script in the same directory.

The HDF Group will use `bzip2` (and other plugins if they become available) to test the feature with the HDF5 libraries under development. For more on the `bzip2` plugin, see the “Building an HDF5 `bzip2` Plugin Example” section on page 17.

## 6 Proposed Changes to the HDF5 Command-line Tools

### 6.1 h5dump, h5ls, and h5copy

Since reading the data is transparent to applications including the HDF5 command-line tools, these command line tools do not require any changes. A small improvement was made to h5dump output to replace “UNKNOWN\_FILTER” with “USER\_DEFINED\_FILTER”.

### 6.2 h5repack

As in the case of the tools mentioned in the section above, h5repack does not require any changes for reading a dataset with an applied third-party filter.

To support an application’s use of a third-party filter while repacking datasets, new syntax is needed to provide filter information to the tool. The required information is the filter identification number, the number of the filter parameters, and the values of the filter parameters. The proposed syntax to specify a user defined filter and its parameters is

```
h5repack -f UD={ID:k; N:m; CD_VAL:[n1,...,nm]}... .
```

where  $k$  is a filter identifier,  $m$  is a number of values in the CD\_VAL array, and  $n_1, \dots, n_m$  are compression parameters. For example, to use bzip2 compression with h5repack, one would use

```
h5repack -f UD={ID:307; N:1; CD_VAL:[9]} file1.h5 file2.h5
```

The enhancements to h5repack will be implemented in the HDF5 release 1.8.12.

## 7 Building an HDF5 bzip2 Plugin Example

The HDF Group provides an example of the HDF5 filter plugin that can be checked out from [https://svn.hdfgroup.uiuc.edu/hdf5\\_plugins/trunk/BZIP2](https://svn.hdfgroup.uiuc.edu/hdf5_plugins/trunk/BZIP2). It contains the source code for the bzip2 plugin library and an example that uses the plugin. It requires the HDF5 Library with the dynamically loaded feature and the bzip2 library being available on the system.

The plugin and the example can be built using `configure` or `CMake` commands. For instructions on how to build with `CMake`, see the `README.txt` file in the source code distribution. The bzip2 library that can be built with `CMake` is available from <https://svn.hdfgroup.uiuc.edu/bzip2/>.

Please follow the instructions below to build with `configure`.

1. Obtain, build, and install the HDF5 Library with the dynamically loaded filter feature.

You may checkout the source from [http://svn.hdfgroup.uiuc.edu/hdf5/branches/hdf5\\_1\\_8/](http://svn.hdfgroup.uiuc.edu/hdf5/branches/hdf5_1_8/) or download <http://www.hdfgroup.uiuc.edu/ftp/pub/outgoing/hdf5/snapshots/v18/hdf5-1.8.11-snap16.tar.gz>.

2. Make sure that `libbz2.so*` is installed on your system. On most UNIX-like systems it will be under `/usr/lib`.

3. Obtain the source code for the plugin using SVN, or download via FTP the source tar ball:

```
svn export https://svn.hdfgroup.uiuc.edu/hdf5\_plugins/trunk/BZIP2 <plugin-dir>  
ftp://ftp.hdfgroup.uiuc.edu/pub/outgoing/HDF5-plugins/BZIP2-plugin.tar.gz
```

4. You can build in place, or you can use the “`srdir`” `configure` option. If you build in place as shown below, you will find the plugin under the `<plugin-dir>/plugins` directory.

```
cd <plugin-dir>  
./configure --with-hdf5=<INSTALL-HDF5-DIR> --with-bz2lib=/usr  
make  
make check  
make install
```

5. Setup the environment variable `HDF5_PLUGIN_PATH` to point to the `<plugin-dir>/plugins` directory with the command line shown below:

```
setenv HDF5_PLUGIN_PATH <plugin-dir>/plugins
```

6. Use `<INSTALL-HDF5-DIR>/bin/h5dump` with the `h5ex_d_bzip2.h5` file found under the `example` directory of the bzip2 plugin distribution to get an output as shown in the “Reading Data with an Applied Third-party Filter” section on page 6.

## 8 Example: Writing and Reading Compressed Data

This example shows how to write and read data compressed with the bzip2 compression.

```

1 /******
2
3 This example shows how to write data and read it from a dataset
4 using bzip2 compression.
5 bzip2 filter is not available in HDF5.
6 The example uses a new feature available in HDF5 version 1.8.11
7 to discover, load and register filters at runtime.

## 10 Example of Makefile

This is an example for Makefile. Building shared libraries may be tricky. Please consult system documentation for the flags on your system. You may also want to consider using `libtool` as we do in the `bzip2` plugin example.

```
1  CFLAGS = -fPIC -g
2  CC = gcc
3  HDF5_INSTALL = /mnt/scr1/_tmp/_build/hdf5/
4  BZIP2_INSTALL = /mnt/scr1/bzip2-1.0.5
5  MAJOR = 0
6  MINOR = 1
7  NAME1 = H5Zbzip2
8  VERSION = $(MAJOR).$(MINOR)
9
10 # Include files in hdf5/src build/src directories for hdf5.h and
    H5pubconf.h
11 INCLUDES = -I./ -I$(HDF5_INSTALL)/include -I$(BZIP2_INSTALL)
12
13 lib: lib$(NAME1).so.$(VERSION)
14
15 $(NAME1).o: $(NAME1).c
16     $(CC) $(CFLAGS) $(INCLUDES) -c $(NAME1).c
17
18 lib$(NAME1).so.$(VERSION): $(NAME1).o
19     $(CC) -shared -Wl,-soname,lib$(NAME1).so.$(MAJOR) $^ -o $@ -
L/$(BZIP2_INSTALL) -lbz2
20
21 clean:
22     $(RM) *.o *.so*
23
24 distclean:
25     $(RM) *.o *.so*
```

## 11 Revision History

<i>March 31, 2013</i>	Version 1 shared with developers who worked on the project.
<i>April 9, 2013</i>	Version 2 shared with The HDF Group developers.
<i>April 16, 2013</i>	Version 3: accepted changes from Mark
